Testing Report – Online Food Delivery & Table Reservation System

1. Introduction

This document outlines the testing process conducted for the Online Food Delivery and Table Reservation System. It includes various test cases designed to validate the functionality, reliability, and performance of the system. The system enables users to browse restaurants, place food orders, and reserve tables efficiently.

2. Test Cases Table

Test Case	Input	Expected Output	Result
TC01 – User Registration	Valid user details	Account created successfully	Pass
TC02 – User Login	Valid credentials	User redirected to dashboard	Pass
TC03 – Invalid Login	Wrong email/password	Error message displayed	Pass
TC04 – View Menu	Open menu page	TOMATO restaurant menu displayed	Pass
TC05 – Add to Cart	Select food items	Items added to cart	Pass
TC06 – Place Order	Valid order details	Order placed successfully	Pass
TC07 – Real-time Order Update	Order placed	Live updates using Socket.IO	Pass
TC08 – Table Reservation	Date, time, guests	Table booked successfully	Pass
TC09 – Invalid Reservation	Invalid date/time	Error message displayed	Pass
TC10 – Email Notification	Order/booking confirmed	Confirmation email sent	Pass
TC11 – Logout	Click logout	User logged out successfully	Pass

3. Functional Testing

The system was tested for all major functionalities including:

- User authentication (login & registration)
- Restaurant browsing and menu viewing
- Food ordering system
- Table reservation system
- Real-time updates using Socket.IO
- Email notifications using Nodemailer

All functionalities performed as expected without critical issues.

4. Performance Testing

- The system handled multiple users efficiently.
- Real-time updates were delivered with minimal latency.
- API responses were tested using Postman and showed acceptable response times.

5. Security Testing

- Passwords are securely hashed using **Bcrypt**
- Authentication handled using **JWT tokens**
- Protected routes prevent unauthorized access
